1. Introduction

Data Management is a vital activity in a modern data centre. The ever increasing amounts of data make it necessary to find easy solutions to manage the backup and recovery process in a IBM z/OS environment. XRS for z/OS and XRS+ simplify the handling of these demands as part of the data management process.

XRS for z/OS offers a powerful and comfortable method of collecting data from backups created with IBM DFSMSdss. The gathered information can be used to easily find and recover data using the XRS for z/OS ISPF interface.

The functionality can be further enhanced by using XRS+, which can analyse, report and monitor who did what with your corporate z/OS data. GUI based dataset recovery is also possible.

1.1. XRS Documentation

The XRS documentation consists of 3 manuals:

- "XRS Vnnn: General Information"
- "XRS Vnnn: Installation and Operations Guide"
- "XRS Vnnn: Users Guide" (this manual)

This manual describes the XRS ISPF recovery management dialog.

2. XRS Recovery Management Dialog

2.1. Starting the Dialog

Use the sample REXX exec "STARTDLG" to start the XRS ISPF dialog. All datasets required to execute the XRS dialog are allocated in this sample and must be changed to meet the installation standards. If the XCS and XRS loadlibs are concatenated in the Linklist, then remove the corresponding LIBDEF command from the sample.

The output class of the XRSDMSGSGS sysout file can also be changed in "STARTDLG".

An ISPF Table library is also allocated. This should be changed to reflect the installation dataset, containing the ISPF table with the default XRS options.

If the installation uses the improvIT TSO application management tool eXtended Productivity Facility (XPF), then use the supplied sample application definition Gateway "XRSGATE".

Note: The terminal must be configured as at least a Model 3 with a minimum display size of 32*80.

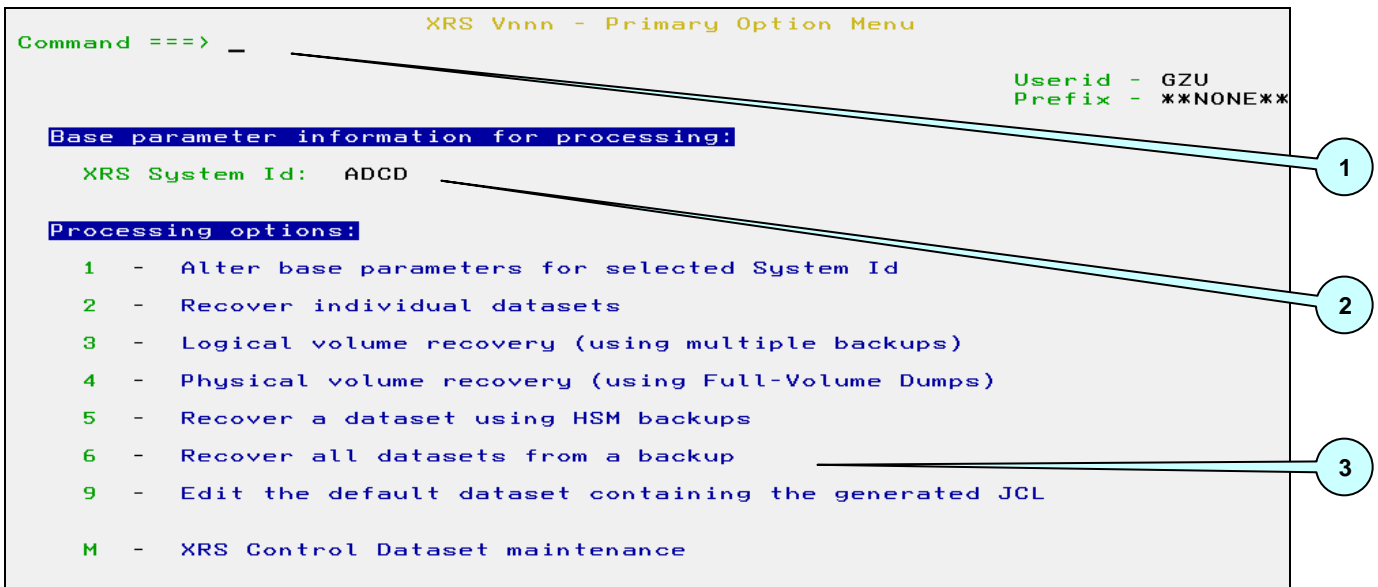

2.2. XRS Primary Option Menu

This selection panel is displayed initially. It is possible to change the default processing options, to recover datasets and volumes and perform XRS Control Dataset maintenance.

```
Command ===> - XRS Vnnn - Primary Option Menu
Userid - GZU
Prefix - **NONE**

Base parameter information for processing:
XRS System Id: ADCD

Processing options:
1 - Alter base parameters for selected System Id
2 - Recover individual datasets
3 - Logical volume recovery (using multiple backups)
4 - Physical volume recovery (using Full-Volume Dumps)
5 - Recover a dataset using HSM backups
6 - Recover all datasets from a backup
9 - Edit the default dataset containing the generated JCL
M - XRS Control Dataset maintenance
```

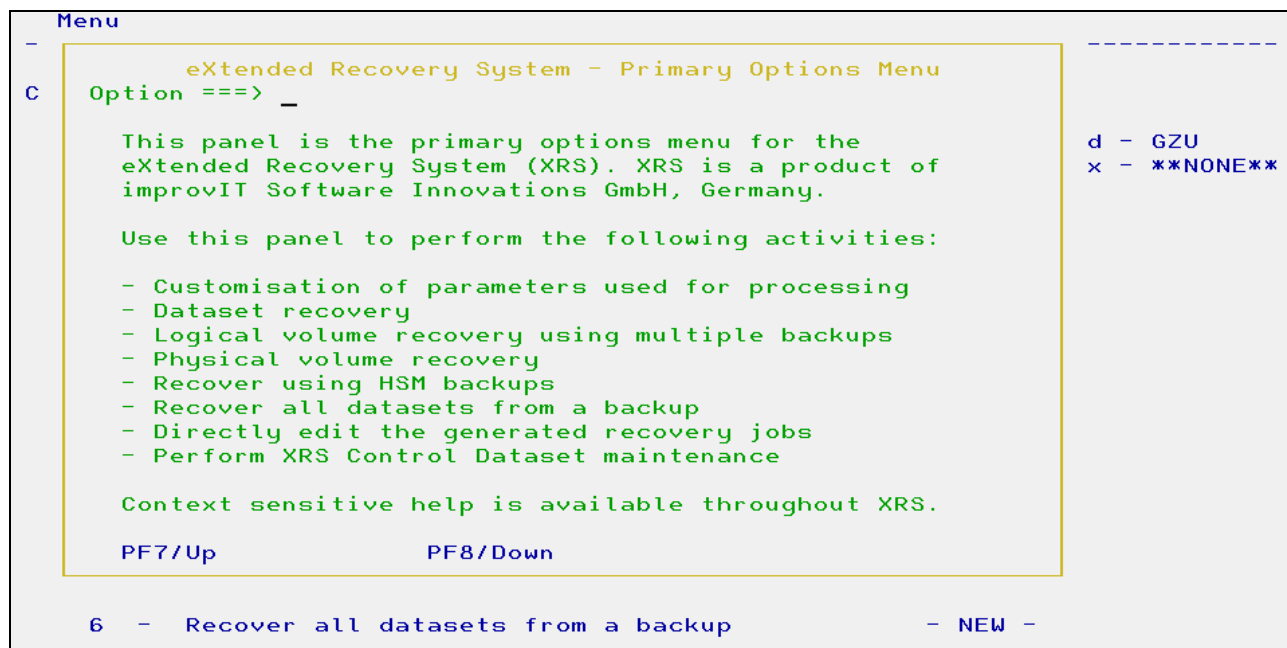

Screen 1: XRS Primary Option Menu

1. Select one of the displayed processing options.
2. Supply the name of the XRS System Id. This value can be used to group various parameter combinations. All processing options use the parameters associated with the currently entered XRS System Id.
3. *This is a new option in V490.*

2.3. Online Help

Context sensitive help is available throughout the XRS ISPF dialogs. By pressing PF1/HELP when the cursor is on an input field, specific information is displayed. Otherwise general help information will be shown.

Screen 2: Online help

2.4. Parameter Maintenance

This panel allows the user to select which processing options need to be changed.

```
Command ==>> _                               XRS Vnnn - Parameter Maintenance
                                                Userid      - GZU
                                                Prefix      - **NONE**
                                                XRS Sysid   - ADCD

Processing options
0 - XRS processing defaults
1 - XCDS data set names - NEW -
2 - Common recovery JCL parameters
3 - XRS Log File parameters
4 - Special parameters for volume recovery
```

Screen 3: Parameter maintenance

1. *This is a new option in V510*

2.4.1. XRS Processing Defaults

The following dialog sets some default processing values and controls certain XRS runtime parameters.

Note: Always press enter to save the displayed values before exiting the XRS parameter dialogs!

```

Command ==>                                XRS Vnnn - Processing Defaults

                                             Userid   - GZU
                                             Prefix   - **NONE**
                                             XRS Sysid - ADCD

XRS Dialog Defaults
Prompt for new dataset/volume name:      N      (Y/N)
Prompt when dataset name is unchanged:   N      (Y/N)
Include new XRS Log files:               N      (Y/N)
Search for (newer) HSM backups:         Y      (Y/N)

XRS Runtime
Sysout class for processing log files:   *
Unit for work datasets:                 SYSDA
Sortout space allocation in cylinders:   10
I/O Record buffer size:                 10000

Press ENTER to save changes or END to terminate
    
```

Screen 4: Processing defaults

1. Set the default values to be used in the XRS recovery dialogs. These defaults can be overridden in the corresponding dialogs when recovering files.
2. Specify the class to be used for all XRS sysout message files. A default work unit name is also required. This is used when XRS allocates internal work files. If problems occur, then try increasing the size of the sort allocation. The record buffer size should not be changed unless instructed to do so by the improvIT Software Innovations support team.
3. This is a new option in V490. If specified then for each dataset displayed in the “Dataset Recovery Selection” a check for (newer) HSM backups for this dataset is performed.

2.4.2. XCDS data set names

Use this dialog to specify one or more (up to 9) XCDS data set names.

```
Command ==>                                XRS Vnnn - XCDS data set names
                                             Userid      - GZU
                                             Prefix       - **NONE**
                                             XRS Sysid    - ADCC

XRS Recovery Data
XRS Control Dataset 1:  INST.XRS999.XCDS2012
XRS Control Dataset 2:  INST.XRS999.XCDS2013
XRS Control Dataset 3:  _____
XRS Control Dataset 4:  _____
XRS Control Dataset 5:  _____
XRS Control Dataset 6:  _____
XRS Control Dataset 7:  _____
XRS Control Dataset 8:  _____
XRS Control Dataset 9:  _____

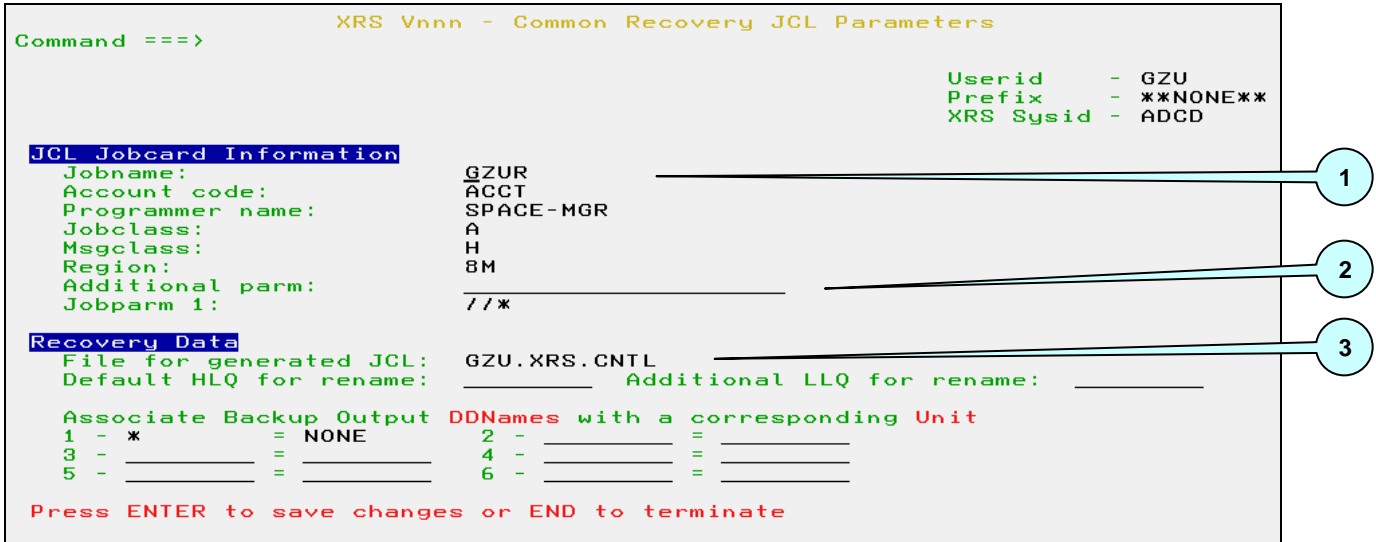

Press ENTER to save changes or END to terminate
```

Screen 5: XCDS data set names

It allows the splitting of the XCDS (e.g. one XCDS for each backup year). It is intended for customers with a large XCDS.

2.4.3. Common Parameters

Use this dialog to specify the common processing options for both dataset and volume recovery.

Screen 6: Parameters – Common

1. Supply all necessary JCL job card values. These are used when recovery JCL is generated.
2. Supply an optional JCL parm (e.g. SCHENV=).
3. Specify the name of the dataset which is to contain the generated JCL. A default HLQ and/or an additional LLQ can also be entered. The specified HLQ is used to replace the original dataset HLQ during recovery. This only applies if the user selects the rename option during recovery processing.

Finally DDNames and associated Units may be entered. If datasets are recovered from a backup file which was allocated using an entered DDName, then the corresponding values will be used in the generated JCL. If "NONE" is entered as a Unit, then the corresponding statement will not be generated in the recovery JCL. This is useful if the backup file DDNames are linked to a specific storage medium. If DDName "*" is used, then all unmatched DDNames will inherit the corresponding values.

2.4.4. XRS Log Files Parameters

Use this dialog to specify the log file options. These are used for dataset and full volume recovery.

```
Command ==>                                XRS Vnnn - XRS Log File Parameters
                                             Userid      - GZU
                                             Prefix      - **NONE**
                                             XRS Sysid   - ADCD
XRS Log dataset name or template(s) for realtime recoveries
Include:   INST.XRS999.XRSDLOG*
Exclude:   _____
Press ENTER to save changes or END to terminate
```

Screen 7: Parameters - XRS Log files

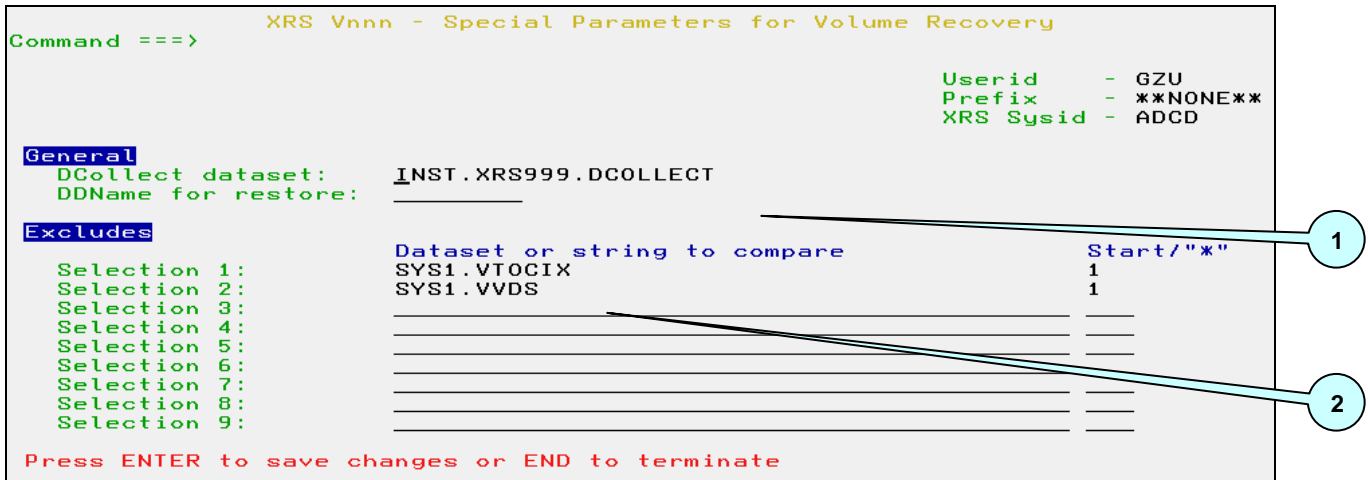

When recovering individual datasets, all information is generally obtained from the XRS Control Dataset. It is however possible to include the currently active XRS Log file(s). This is known as a real-time recovery. Enter either the full name or a template matching the installation XRS Log file naming conventions. Multiple datasets or templates may be entered delimited by a space. The allowed templates are one '*' at the end or at the start of the data set name. In addition to the default XRS Control Dataset all matching XRS Log files are then searched for dataset recovery information.

It is also possible to exclude other file names matching the template in order to avoid processing errors.

Note: It is important that the optional secondary XRS Log file is not found by the "include" template. Otherwise duplicate or outdated dataset backup entries may be shown in the XRS ISPF recovery management dialog. Furthermore templates such as "*.xxxx" should not be used, as they can result in very long response times.

2.4.5. Volume Recovery Parameters

Use this dialog to specify the processing options only used for volume recovery.

Screen 8: Parameters - Volume recovery

1. The datasets required for volume recovery are based upon information created by the IBM IDCAMS DCollect utility. Enter the name or template of the DCollect file. The allowed templates are one "*" at the end or at the start of the data set name. This should be created on a regular basis (e.g. daily). A sample job DCOLLECT can be found in the XRS samplib.

If volume backups always use the same DDName for the output backup file, then enter the value here. This allows backup information to be more accurately matched during recovery job generation. The shown value can be overridden prior to recovery processing.

2. Enter dataset names or parts thereof which are to be bypassed during volume recovery information. An explicit position of the string in the dataset name can be entered or an "*" can be used to define, that the string may be anywhere within the dataset name. Matching dataset names are then bypassed during recovery processing. This can for example be used to bypass datasets containing the strings VTOC and VVDS.

2.4.6. Saving Parameters

Generally all entered values are only valid for the current user. If you wish to define default installation values for all users, then perform the following steps:

1. Copy the created profile member (e.g. XRSPROF) from your ISPPROF dataset to a common ISPF table library.
2. Allocate the common ISPF table library using LIBDEF with ISPTLIB prior to starting XRS. If you use the product “eXtended Productivity Facility (XPF)”, just add the common table library to the application definition gateway.
3. All users will now use the default values. Changes are only stored in the users private profile dataset.

3. XRS Dataset Recovery Dialog

3.1. Dataset Recovery

Certain IBM DFSMS restrictions apply, when recovering individual datasets from IBM DSS full volume dumps. These must be appropriately handled:

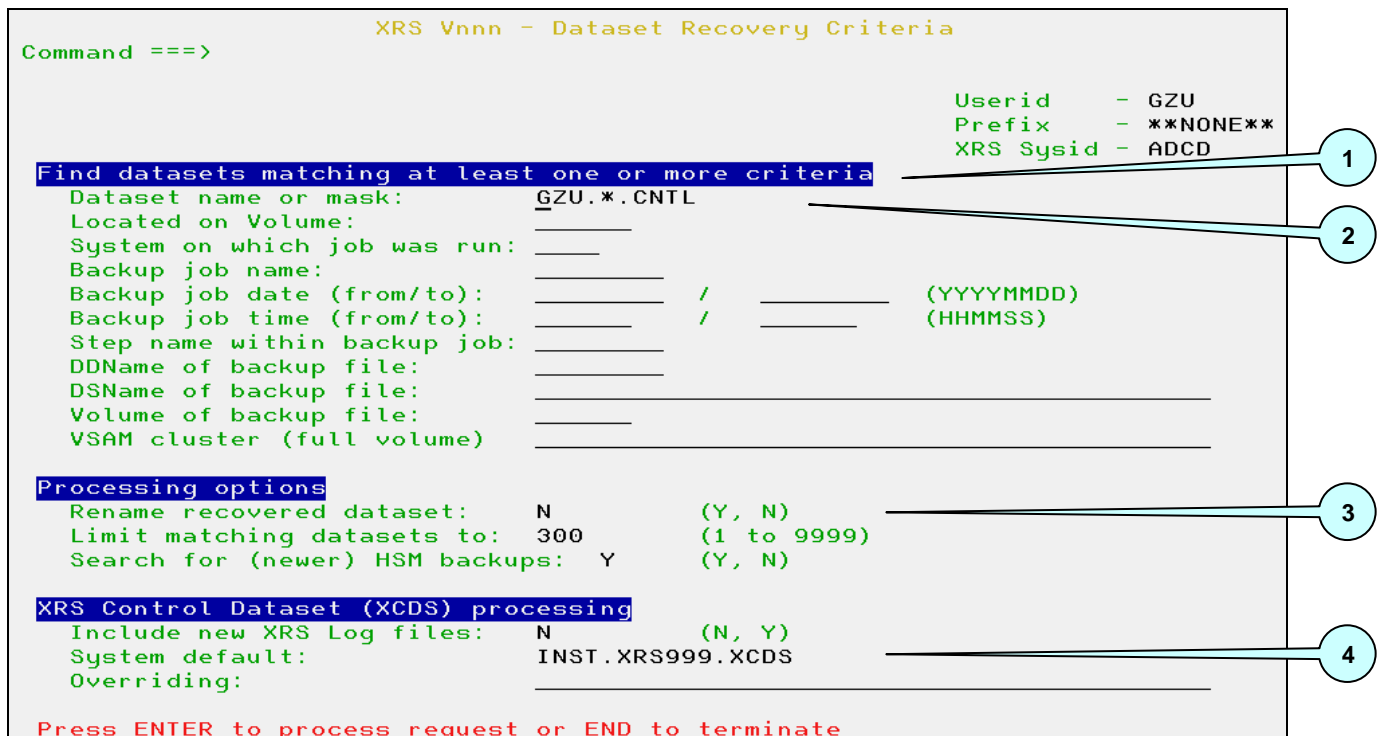

- VSAM datasets are not automatically recataloged
- Multi-Volume datasets are not completely recovered. Only the data on the selected volume is restored. This could result in damaged files

See the IBM documentation for further details. XRS generates an appropriate message in the recovery JCL when datasets are restored from full volume dumps.

We recommend the use of IBM DSS logical backups to avoid these problems.

3.1.1. Dataset Recovery Criteria

This panel is displayed when individual datasets need to be recovered. Datasets can be selected using specific criteria. Processing options and XRS backup information source files can also be specified. The default values for "Rename recovered datasets" and "Include new XRS Log files" may be changed using the options dialog.

Screen 9: Dataset recovery criteria

1. Enter at least one of the selection criteria to find matching datasets from the XRS

Control Dataset. If more than one criterion is entered, then only datasets matching all criteria are displayed. If "Volser of Backup file" is less than 6 bytes long, then a generic search is performed (equivalent to XXX*).

2. A template (like in ISPF 3.4) is possible for the dataset name: it may contain a single asterisk, a double asterisk or a percent sign.

The following rules apply:

The single asterisk '*' is used in place of exactly one qualifier (e.g. SYS1.*.LINKLIB). In addition, it can be used to indicate that only the beginning/middle/end of a qualifier has been specified (e.g. SYS1.*LIB, SYS*.LINKLIB, S*1.L*B).

Two asterisks are the maximum permissible in a qualifier. If there are two asterisks in a qualifier, they must be the first and last characters.

The double asterisk '**' indicates either the nonexistence of a qualifier or the fact that any number of qualifiers play no role in the selection process (e.g. IBMUSER.**.PROFILE).

R e s t r i c t i o n : The double asterisk may only occur once in the mask (e.g. SYS1.**.*LIB.** is not allowed).

A '*' in the beginning and at the end is allowed. In this case a string search in the dataset name is performed (new in V290).

The percent sign '%' acts as a place holder for exactly one single character. A '%' can be specified more than once, in any level of the qualifier (e.g. SY%1.LI%%LI%). A '%' cannot match a null string '' or a period '.'.

Specify a '**' to see all records in the XCDS data set.

3. Selected datasets can be automatically renamed during recovery processing. The user is prompted during JCL generation and can then specify a new name for the dataset being recovered. If a default HLQ was defined in the dataset recovery options, then this value will be used in the suggested new dataset name. The number of displayed matching backup records can also be restricted here.
4. The default XRS Control Dataset can be overridden here. Optionally enter the name of an alternate XRS Control Dataset. If the required backup information has not yet been copied from the current XRS Log file, then activate the corresponding option to include these files in the search for recovery information. ***If you have specified more than one XCDS dataset in the options then only the first XCDS will be displayed.***

3.1.2. Dataset Recovery Selection

This panel displays all datasets found in the XRS Control Dataset and optionally the XRS Log file(s) matching the entered selection criteria. Detailed information for each dataset backup may be displayed or dataset recovery JCL can be generated.

```

XRS Vnnn - Dataset Recovery Selection      Row 1 to 2 of 2
Command ===> _                             Scroll ===> PAGE

Userid   - GZU
Prefix   - **NONE**
XRS Sysid - ADCD

Select one or more datasets to recover

IHR Dataset Name                HSM Backup:
_   GZU.TS0.CNTL                 * 20120425 113613 GZU7      IMP002
_   GZU.XRS.CNTL                 ** 20120425 113613 GZU7      IMP002
***** Bottom of data *****

*** XRS0014I - 2 records selected from XRS Control Dataset(s) (XRSEREXS) ***
    
```

Screen 10: Dataset backup information

Enter either an "I" to display detailed backup information or "R" to recover the dataset. More than one dataset may be processed at any one time. An "H" may also be entered. In this case the HSM recovery dialog is started. This function is described later.

The primary dialog command "R" may be used to set the processing option "R" for all shown datasets. To reverse the selection use "***".

The HSM column is new in V490:

*A "**" indicates that a HSM backup exists for this dataset.*

*A "***" in this column indicates that a newer HSM backup exists for this dataset.*

To check, enter an "H" in front of the dataset.

3.1.3. Backup Dataset Details

If an "I" is entered in front of one of the displayed dataset names, then all available backup information is shown.

```

XRS Vnnn - Detailed Dataset Backup Information
Command ==> _

Userid      - GZU
Prefix      - **NONE**
XRS Sysid   - ADCD

Source Dataset Statistics
Name:       GZU.XRS.CNTL
Volume:     IMP002      Creation Date: 12075      Change Flag: Y

Screen 12: Detailed dataset backup information for multi-volume datasets

There are two possible multi-volume display variations:

- Details for sequential or VSAM multi-volume files

In the following example, additional information for a multi volume sequential dataset is displayed:

```

XRS Vnnn - Multi-Volume Dataset Backup Information
Command ==> _

* Press Enter for detailed backup information *
Userid      - GZU
Prefix      - **NONE**
XRS Sysid   - ADCD

Source Dataset (current fragment)
Name:       SYS1.TEST.MULTIVOL
Volume:     ZCPRD1
Creation Date: 12131

Multi-Volume Fragment Information
Found in Catalog: Y
Other Volumes:  ZCPRD2 ZCPRD1 ZCPRD3
    
```

Screen 13: Multi-volume dataset backup information

All volumes on which dataset fragments were located at the time of the backup are displayed.

Note: Volume information is only available, if the system on which the backup was executed, could access the corresponding dataset catalog. Otherwise a message is displayed.

If the backed up file was a VSAM multi-volume dataset, which was backed up using a DFSMSdss physical volume dump, then additional information is shown in red. Multi-volume information may be displayed by pressing Enter.

```

Screen 14: Detailed dataset backup information for VSAM datasets

After pressing ENTER the additional information for VSAM datasets is displayed:

eXtended Recovery System (XRS) for z/OS

```

XRS Vnnn - Multi-Volume Dataset Backup Information
Command ==> _

* Press Enter for detailed backup information *

Userid      - GZU
Prefix      - ***NONE**
XRS Sysid   - ADCD

Source Dataset (current fragment)
Name:       SYS1.TEST.KSDATA
Volume:     ZCPRD1
Creation Date: 12130

Multi-Volume Fragment Information
Found in Catalog: Y
Other Volumes: ZCPRD2 ZCPRD1

VSAM Information
Cluster Name: SYS1.TEST.KSDS1
VSAM Type:    KSDS
Fragment Type: Data
Catalog Name: N/A
```

Screen 15: VSAM dataset backup information

The multi-volume information corresponds to that of the sequential files. The VSAM values are also shown.

Note: When a recovery is performed on a multi-volume fragment, only that fragment is recovered by XRS. The recovery JCL however contains further information about other fragments at the time of the backup. This can be used to perform a separate recovery. We recommend that the cluster name is used to identify all available backups within XRS.

3.1.4. Dataset Recovery Processing

The following window is displayed when one or more datasets were selected for recovery. The name of the default dataset and member containing the generated JCL can be overridden. Replace must be specified if the member already exists.

```

XRS Vnnn - Dataset Recovery Selection      Row 1 to 2 of 2
Command ==>                               Scroll ==> PAGE
                                           Userid   - GZU
                                           Prefix   - **NONE**
                                           XRS Sysid - ADCD

Select one or more datasets to recover

Listing 1: Dataset Recovery JCL

3.1.6. DSS Dataset Recovery Options

When generating recovery jobs, XRS assumes that the target datasets can be found in the catalog. The following table shows the possible dataset recovery combinations and options with the corresponding DSS recovery parameter.

Source and recovery target datasets	Option "Rename" selected?	Target dataset found in catalog?	Option "Replace" selected in Rename dialog?	Generated DSS option
Same	No	Yes	n/a	Replace
Same	No	No	n/a	Catalog
Same	Yes	Yes	No	No job is generated – user is prompted to change the "Replace" option
Same	Yes	Yes	Yes	Replace
Different	Yes	Yes	No	No job is generated – user is prompted to change the "Replace" option
Different	Yes	Yes	Yes	Replace
Different	Yes	No	No	Catalog
Different	Yes	No	Yes	Catalog

Table 1: DSS Dataset Recovery Options

Under certain circumstances an invalid parameter may be generated (e.g. the target dataset exists but is not catalogued). In such special situations, the DSS parameter must be manually validated prior to restoring the dataset.

4. XRS Logical Volume Recovery Dialog

4.1. Logical Volume Recovery

Certain IBM DFSMS restrictions apply, when recovering individual datasets from IBM DSS full volume dumps. These must be appropriately handled:

- VSAM datasets are not automatically recataloged
- Multi-Volume datasets are not completely recovered. Only the data on the selected volume is restored. This could result in damaged files

See the IBM documentation for further details. XRS generates an appropriate message in the recovery JCL when datasets are restored from full volume dumps.

We recommend the use of IBM DSS logical backups to avoid these problems.

4.1.1. DCollect Selection

The following panel is shown when volume recovery is selected from the XRS primary option menu. All DCollect datasets matching the template in the volume recovery options are displayed.

```

XRS Vnnn - DCollect Dataset Selection      Row 1 to 1 of 1
Command ===> _                               Scroll ===> PAGE
                                           Userid   - GZU
                                           Prefix   - **NONE**
                                           XRS Sysid - ADCD

Select a DCollect dataset which contains the required volume information

S/B Dataset Name                               Volume   Crt. Date
_ INST.XRS999.DCOLLECT                         IMP002   2012/117
***** Bottom of data *****

*** XRS0028D - 1 DCollect dataset(s) found matching template
"INST.XRS999.DCOLLECT" (XRSERVOL) ***
    
```

Screen 18: DCollect dataset selection

Enter "S" in front of the required DCollect dataset name to use this for volume recovery processing. If "B" is entered then the raw contents of the DCollect file are displayed.

4.1.2. Volume Criteria

Use this dialog to enter the logical volume recovery selection criteria. These are then used to select the volumes and the corresponding datasets for recovery.

```
Command ==>                                XRS Vnnn - Volume Selection

                                             Userid   - GZU
                                             Prefix    - **NONE**
                                             XRS Sysid - ADCD

Selection Criteria

Volume(s) to recover:                    IMP*__
Recover using newest backup files: Y      (Y/N)
DDName of backup file:                    _____

Press ENTER to process request or END to terminate
```

Screen 19: Volume selection criteria

Enter a volume or a volume template to recover. The selected DCollect dataset is then searched for datasets on matching volumes. After all datasets on the required volumes have been extracted, matching entries in the default XRS Control Dataset are selected. If "exclude datasets" were specified in the volume recovery options, then these will be bypassed. Generally the newest matching backup file entry found in the XRS Control Dataset is used to recover a dataset. Otherwise change the "newest backup file" option to use backups not newer than the creation date of the DCollect dataset. Optionally enter a ddname to recover volumes only using backup files created with the specific ddname. This can be useful if individual dataset backups are not to be included in a volume recovery.

4.1.3. Volume Selection

This panel displays a list of matching volumes found in the selected DCollect dataset. Volume statistics are also shown. Datasets on the volumes may now be displayed or volume recovery JCL generated.

```

XRS Vnnn - DCollect DASD Volume Selection  Row 1 to 1 of 1
Command ===> _                               Scroll ===> PAGE

Userid    - GZU
Prefix    - **NONE**
XRS Sysid - ADCD

Select a volume to process

S/R Volume   Space (in MB)      Device      Number of   Number of
            Used      Free              Type      Addr      datasets   XCDS matches

5. XRS Physical Volume Recovery Dialog

5.1. Physical Recovery

Certain IBM SMS restrictions apply, when recovering disks from IBM DSS full volume dumps. These must be appropriately handled.

- VSAM datasets are not automatically recataloged
- Multi-Volume datasets are not completely recovered. Only the data on the selected volume is restored. This could result in damaged files

See the IBM documentation for further details.

5.1.1. Volume Recovery Criteria

This panel is displayed when physical volumes need to be recovered. Volumes can be selected using specific criteria. Processing options and XRS backup information source files can also be specified.

```

Command ==>                                XRS Vnnn - Volume Recovery Criteria
                                             Userid      - GZU
                                             Prefix      - **NONE**
                                             XRS Sysid   - ADCD

Find volumes matching at least one or more criteria
Volume(s):                                IMP*

XRS Control Dataset (XCDS) processing
Include new XRS Log files: N              (N, Y)
System default: INST.XRS999.XCDS2012
Overriding: _____

Press ENTER to process request or END to terminate
    
```

Screen 24: Full volume recovery search criteria

1. Enter at least one selection criteria to be used to match volumes from the XRS Control Dataset. If more than one criteria is entered, then only volumes matching all criteria are displayed.
2. Selected volumes can be recovered to alternate disks. The user is prompted during JCL generation and can specify a new name for the volume being recovered. The number of displayed matching backup records can also be restricted here.
3. **This is a new option in 510.** If set to 'Y' then HSM is called to indicate if (newer) HSM backups are available for the volume.

- The default XRS Control Dataset can be overridden here. Optionally enter the name of an alternate XRS Control Dataset. If the required backup information has not yet been copied from the current XRS Log file, then activate the corresponding option to include these files in the search for recovery information.

5.1.2. Volume Selection

This panel displays all matching volumes found in the XRS Control Dataset and XRS Log file(s), matching the entered selection criteria. Detailed information for each volume may be displayed or recovery JCL can be generated.

```

Command ==> _                               XRS Vnnn - Volume Recovery Selection      Row 1 to 3 of 3

Listing 3: Generated recovery JCL

6. XRS HSM Backup Recovery Dialog

6.1. Recovery Selection

6.1.1. Dataset Recovery Criteria

This panel is displayed when recoveries using HSM backups are required. It can be directly called from the XRS Primary Menu or from the dataset lists displayed in the other recovery methods (dataset or logical volume).

```

XRS Vnnn - Dataset HSM Recovery Criteria
Command ==>

Userid   - GZU
Prefix   - **NONE**
XRS Sysid - ADCD

Find dataset matching
Dataset name or level:  GZU.TSO.CNTL
Processing options
Rename recovered dataset:  Y      (Y, N)
Replace original dataset:  N      (Y, N)

Press ENTER to process request or END to terminate
    
```

Screen 31: HSM backup search criteria

1. Enter a dataset name to recover (a template is allowed here (ending with a '*', same syntax as the HLIST command).
2. Specify whether the dataset is to be renamed or replaced.

This panel displays all available HSM backup information for the requested dataset. Enter "R" in front of the required version to generate the recovery JCL.

```

XRS Vnnn - Dataset HSM Backup Selection   Row 1 to 2 of 2
Command ==> _                               Scroll ==> PAGE

Userid   - GZU
Prefix   - **NONE**
XRS Sysid - ADCD

Select one version to recover:

R Dataset Name                               Backup:
_ GZU.TSO.CNTL                               Gen Ver Date      Time
_ GZU.TSO.CNTL                               002 000 19.04.2012 16:58:54
_ GZU.TSO.CNTL                               001 001 18.04.2012 10:36:28
***** Bottom of data *****
    
```

Screen 32: List of available HSM backups

6.1.2. Dataset Recovery Processing

The following window is displayed when a recovery was requested. The name of the default dataset and member containing the generated JCL can be overridden. Replace must be specified if the member already exists.

```

XRS Vnnn - Dataset HSM Backup Selection      Row 1 to 2 of 2
Command ===>                               Scroll ===> PAGE
                                           Userid   - GZU
                                           Prefix   - **NONE**
                                           XRS Sysid - ADCD

Select one version to recover:

R Dataset Name                               Backup:
r  GZU.TSO.CNTL                             Gen  Ver  Date      Time
_  GZU.TSO.CNTL                             002  000  19.04.2012  16:58:54
***** Bottom of data *****
    
```

```

Menu
-----

Specify the name of the target JCL dataset and member
Name       : GZU.XRS.CNTL (GZUR)
Replace    : Y                               (Y/N)
* Press ENTER to continue or END to terminate
    
```

Screen 33: Select JCL dataset

If the rename option was requested on the recovery selection panel, then the following screen is displayed. Enter an alternate dataset name to be used for recovery processing.

```

Menu
-----
C  Menu
   XRS Vnnn - Rename Recovered Dataset
Command ===>
Enter a new dataset name for the recovery
Old Name:  GZU.TSO.CNTL
New Name:  GZU.TSO.CNTL
Replace   : N                               (Y/N - Only used when the new dataset exists)
* Press ENTER to continue
    
```

Screen 34: Specify alternate dataset name

6.1.3. Dataset Recovery JCL

After all information has been entered, the JCL needed to recover the selected dataset is created and displayed.

```
/******  
/*  
/* Recovering - *  
/* Dataset: GZU.TSO.CNTL *  
/* *  
/* HSM Backup Information - *  
/* Date: 19.04.2012 *  
/* Time: 16:58:54 *  
/* Version: 002 *  
/* Generation: 000 *  
/* *  
/******  
//RECOV00I EXEC PGM=IKJEFT1A  
//SYSTSPRT DD SYSOUT=*  
//SYSTSIN DD *  
 HRECOVER 'GZU.TSO.CNTL' +  
 GENERATION(000) VERSION(002) +  
 WAIT  
/*
```

Listing 4: Generated HSM recovery JCL

Note: If a dataset is migrated, then the recovery process will fail. This is a restriction within HSM. Either recall the dataset manually using TSO/ISPF or add the HRECALL command with the WAIT option prior to the HRECOVER statement.

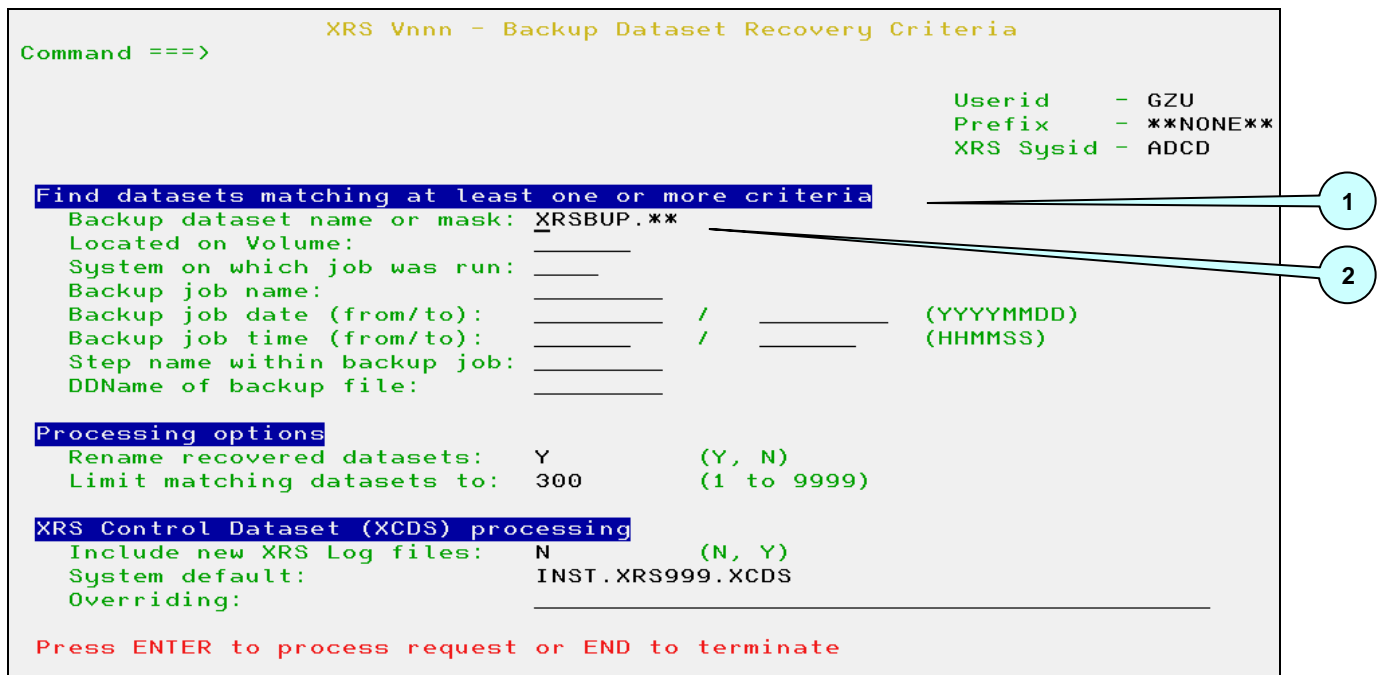

7. XRS Backup dataset dialog

7.1. Backup Datasets

This is a new option in V490. It allows to restore all datasets from a DFDSS backup in an easy way.

7.2. Backup Dataset Recovery Criteria

This panel is displayed when all datasets of a backup need to be recovered. Backup datasets can be selected using specific criteria. Processing options and XRS backup information source files can also be specified. The default values for "Rename recovered datasets" and "Include new XRS Log files" may be changed using the options dialog.

Screen 35: Backup dataset Recovery Criteria

1. Enter at least one of the selection criteria to find matching backup datasets from the XRS Control Dataset. If more than one criterion is entered, then only datasets matching all criteria are displayed. If "Volser of Backup file" is less than 6 bytes long, then a generic search is performed (equivalent to XXX*).
2. A template (like in ISPF 3.4) is possible for the backup dataset name: the same rules apply as for the dataset name in the "Dataset Recovery Criteria" (see 7.1.1 for details).

7.3. Backup Dataset Selection

This panel displays all backup datasets found in the XRS Control Dataset and optionally the XRS Log file(s) matching the entered selection criteria. Detailed information for each backup dataset may be displayed or dataset recovery JCL can be generated.

```

XRS Vnnn - Backup Dataset Selection          Row 1 to 3 of 3
Command ==> _                               Scroll ==> PAGE
                                           Userid   - GZU
                                           Prefix   - **NONE**
                                           XRS Sysid - ADCD

Select one backup dataset to process

IR  Backup dataset Name                    Backup:
   _ XRSBUP.XRS999.BUP1#GZU                Date    Time   Jobname  Vol
